

Introduction

The 2001 data set for Louisiana contains 56,156 records. It includes children undergoing screening tests in both public and private health care facilities. From this dataset, data on children between the ages of 6 months to 72 months were extracted. Among them, 72 had no blood lead test result listed. They were excluded from the dataset. The final dataset included 44,246 records. **Only one record for each child was included. This record indicated the maximum blood lead level test result for that specific child in the year 2001.** Venous and capillary blood specimens are included. 4,766 (10.77%) of the samples were venous blood specimens and 27,073 (61.19%) were capillary. The specimen type was not reported for 12,407 (28.04%) children. Missing values by field are included in the report.

The data set was then divided into two datasets, one containing records from screenings conducted in public health care facilities and the other containing records from private health care facilities. Once again, the maximum blood lead level on individual child was included in the dataset. The private dataset contains 33,986 records and the public dataset contains 10,957 records. Records from the two datasets do not equal the total number of records in the final dataset for 2001 because the maximum blood lead level on individual child was taken into account separately for tests in public health care facilities and private health care facilities. **This report contains analysis of data obtained from both private and public health care facilities.** Separate reports have been generated for private health care data and public health care data.

The population estimates of children age 6 to 72 months were taken from the 2000 U.S. Census. To best estimate the number of children aged 6 to 12 months, half of the total number of children under 1 year of age was taken into account for each parish.

Overall, in the combined dataset, the screening rate for children age 6 to 72 months in Louisiana in 2001 was 12.65% with a total of 2,925 children having an elevated blood lead level ($\geq 10\mu\text{g/dl}$).
